Gamer 1 Choice Gamer 2 Choice Result **Rock** Scissors Rock wins (blunts/crushes scissors) **Rock** Paper Paper wins (covers rock) **Rock** Rock Tie (play once again) **Paper** Rock Paper wins (covers rock) **Paper** Scissors Scissors wins (cuts paper) **Paper** Paper Tie (play again) **Scissors** Paper Scissors wins (cuts paper) **Scissors** Rock Rock wins (blunts/crushes scissors) **Scissors** Scissors Tie (play again)

Mathematically, the game is a zero-sum game with a game-theoretic optimal strategy: choosing Rock, Paper, or Scissors consistently at random one-third of the time. If both players play randomly, the game will theoretically lead to a continuous series of ties, with each gamer holding a 33.3% opportunity of winning, a 33.3% chance of losing, and a 33.3% possibility of tying.

The Psychology of Human Play

Human beings, unlike computers, are inherently dreadful at creating true randomness. Due to the fact that the game is played by people depending on intuition and instinct, it is heavily affected by cognitive predispositions and mental patterns. Scientists have spent years studying these patterns, yielding interesting insights into how to exploit them.

Common Human Tendencies

- **The Power Throw:** In consecutive rounds, untrained gamers show a strong subconscious bias towards throwing Rock. Rock represents strength and hostility, making it the mental default when gamers feel forced.
- **The Retaliation Rule:** If a gamer loses a round, they tend to switch to the component that *would have beaten* their opponent's previous include the very next round. For instance, if Player A loses to Paper, they are statistically most likely to throw Scissors next.
- **Predictable Patterns in Sequences:** When playing multiple rounds, human beings often fall under predictable loops. They rarely throw the exact very same symbol 3 times in a row, believing it makes them look uncreative.
