Growing Hibiscus

Before growing Hibiscus, a fair amount of planning is required. Do you want to grow them in your garden, use them for landscaping or hedging or keep them pots that can be kept indoors or out? What size and type of plant do you want? Potted culturing has to be confined to the smaller varieties. For outdoors, the size is dependent on the use. Large types are ideal for landscaping. Those used as hedges can be medium in size. If you want the Hibiscus to blend with other plants in the garden, smaller ones are ideal. For bonsai, use old, compact plants with small leaves. Check with nurseries or other growers in your area to ascertain which species is best suited for you. You cannot be sure of the color of the flowers unless a plant you purchase is in bloom. There are plants that give common but romantic five petal singles or ones with double layers. First time gardeners should purchase the right gardening tools, accessories, and perhaps a book on the subject of “growing Hibiscus”. When growing Hibiscus, choose a sunny spot. The plant is tolerant to many conditions, but thrives in sandy soil with some organic content and slight acidity. Planting materials can be obtained from a nursery. The propagation is through cuttings, hybrid-grafting and, in the case of certain species, through tree service roswell ga germinated seeds. Germinated seeds might not have all the characteristics of the mother plant.

The plant has to be watered until it establishes. Moisture retention is important, and mulching helps this. Water the potted plants from the top and not at the base. Proper fertilizing is important, but remember that excessive nitrogen will promote vegetative growth and **You can find out more** may not help the flowering. Pesticides, insecticides and fungicides may have to be used depending on the need. It is best to opt for organic products including fertilizers. Make sure that you follow the label instructions. Hibiscus growing is highly relaxing and satisfying.
