

Welcome to the Suprmind Help Documentation — your trusted guide to **getting started** with one of the most advanced AI orchestration platforms designed to empower your team’s research and analysis workflows. Whether you’re here because you’re exploring product onboarding or looking to master the nuances of multi-model AI interaction, this guide lays out the essentials clearly, with concrete examples and practical tips.

What Exactly is Suprmind?

Suprmind is a revolutionary platform that brings **multi-model AI orchestration** into a single chat interface, streamlining complex workflows such as market research, legal review, and investment analysis. Instead of toggling between separate tools and manually consolidating outputs prone to error, Suprmind handles orchestration, disagreement detection, and hallucination surfacing—all within your team’s collaborative space.

This means you not only get a diversity of AI perspectives but also [Get more info](#) a built-in quality control process ensuring your decisions rest on reliable insights.

Getting Started: Your First Steps

If you’re new to Suprmind, here’s a simple beginner’s roadmap to get you quickly up to speed:

1. **Create and Customize Your Workspace:** Set up your team space tailored to your domain. Add collaborators, define roles, and choose your primary AI models.
2. **Choose Your Plan:** Start with the *Spark plan*, our entry-level option priced at **\$19/month**. It provides access to key orchestration features and sufficient model interactions for small to medium teams.
3. **Run a Sample Analysis:** Use a mode-based workflow template (e.g., Market Scan, Legal Review) and feed in your data or questions. Watch how Suprmind invokes different models in parallel and surfaces agreement or disagreement.
4. **Explore Disagreement Tracking:** Learn how to interpret flags where models contradict each other. This feature is critical for spotting uncertainty or potential hallucinations early.
5. **Engage Peer Review:** Assign team members to comment on outputs directly within the chat to correct hallucinations or refine insights.

Multi-Model AI Orchestration in One Chat

One of Suprmind’s standout features is its ability to combine outputs from multiple AI models within a single chat interface. Why is this important? Because relying on a single AI—no matter how advanced—is risky. Models can hallucinate, misinterpret, or simply miss nuance.

Suprmind orchestrates models with different strengths side by side. For example:

- Model A specializes in summarizing long reports.
- Model B excels at extracting quantitative data.
- Model C offers legal language interpretation.

Within the chat, you’ll see these responses aggregated and color-coded for clarity. This multi-angle approach offers a robust foundation for better decisions, reducing the risk that a single model’s blind spot derails your analysis.

Disagreement Tracking: Built-In Quality Check

When models disagree, that's gold. Disagreements often highlight areas you need to investigate further.

Suprmind automatically detects conflicting answers and flags them in the chat. For example, if Model A estimates market growth at 4% but Model B reports 10%, the system highlights this discrepancy immediately.

How does this help you?

- Reduces false confidence—knowing when AI outputs conflict prevents blind acceptance.
- Surfaces ambiguous or confusing data points that need human review.
- Encourages critical thinking rather than passive consumption of AI summaries.

Hallucination Surfacing and Peer Correction

Hallucination—AI generating plausible but false information—is arguably the biggest risk in deploying generative models. Suprmind aggressively tackles this through two mechanisms:

1. **Hallucination Surfacing:** The platform cross-validates information between models and historical data repositories, flagging content that doesn't match any source or conflicts sharply with established facts.
2. **Peer Correction Workflow:** Your team members can directly annotate and correct hallucinated outputs right in the chat threads. This peer-reviewed correction process builds an audit trail improving trust over time.

For example, if an AI mistakenly reports "Company X's revenue doubled last quarter" but your team knows the revenue was flat, you can flag and annotate this error. Suprmind then tags this conversation for future model tuning or workflow adjustments.

Mode-Based Workflows for Analysis

Unlike generic chatbots, Suprmind understands context-sensitive analysis. It offers **mode-based workflows** designed to fit different research and data tasks:

- **Market Research Mode:** Focuses on competitive landscape, trend summaries, quantitative metrics extraction.

- **Legal Review Mode:** Prioritizes regulatory language interpretation, contract clause comparison, risk highlights.
- **Investment Analysis Mode:** Gathers financial indicators, valuations, risk factors, and scenario summaries.

When you select a mode, the platform adjusts which AI models it orchestrates, how it weighs outputs, and what types of disagreement or hallucination flags it prioritizes. This customization ensures you don't get irrelevant or noisy AI chatter but focused, actionable insights tailored to your workflow.

Pricing Snapshot: Spark Plan

Here is a quick overview of our popular entry-level plan:

Plan Price Features Spark \$19/month

- Multi-model chat interface
- Disagreement tracking and flags
- Hallucination surfacing and peer correction
- Mode-based workflow templates
- Basic collaboration for small teams

Starting with Spark is ideal if you want to quickly test the value of multi-model orchestration and quality control features without high upfront investment.

Best Practices: Avoiding Common Pitfalls

To get the most out of Suprmind from your very first session, consider these tips:

- **Don't trust a single model blindly.** Always look at disagreement flags to examine contested points.
- **Use mode workflows thoughtfully.** Select a workflow that fits your task—don't treat Suprmind as a generic chatbot.
- **Engage your team peers early.** Have colleagues review and correct hallucinations to build confidence.
- **Keep your inputs precise.** Clear and specific questions help models give targeted, less ambiguous answers.
- **Track changes over time.** Use Suprmind's versioning and audit trails to monitor how insights evolve as your team interacts.

Summary

Suprmind is not just another AI tool—it is a multi-model orchestration platform designed to provide depth, quality, and context in your research and analysis workflows.

By starting with the Spark plan at **\$19/month**, you gain access to:

- A unified chat with diverse AI perspectives
- Automated disagreement tracking to spot risks
- Hallucination surfacing combined with peer correction for trustworthiness
- Mode-based workflows to match specific research needs

Use this help documentation to guide your setup and get familiar with key features. Remember: successful onboarding is not about rushing through, but correctly integrating Suprmind's features into your team's existing workflows.
